

CLAIMS

1. A composite comprising collagen and a support matrix made of a fiber structure composed of aliphatic polyester fibers with a mean fiber size of 0.05-50 μm .

2. A composite according to claim 1, wherein said fiber structure is a biodegradable polymer.

3. A composite according to claim 2, wherein said fiber structure is an aliphatic polyester.

4. A composite according to claim 3, wherein said aliphatic polyester is polylactic acid, polyglycolic acid, polycaprolactone or a copolymer thereof.

5. A composite according to claim 1, wherein said support matrix is a cylindrical body with a bellows-shaped section.

6. A composite according to claim 5, wherein said cylindrical body is a cylindrical body which is composed of a fiber structure with a basis weight of 1-50 g/m^2 and has a membrane thickness of 0.05-0.2 mm and a diameter of 0.5-50 mm, wherein the spacing of the bellows-shaped section is no greater than 2 mm and the depth of the bellows-shaped section is 0.1-10 mm.

7. A cylindrical body characterized by being composed of a fiber structure with a basis weight of 1-50 g/m^2 and having a membrane thickness of 0.05-0.2 mm and a diameter of 0.5-50 mm, wherein the spacing of the bellows-shaped section is no greater than 2 mm and the depth of the bellows-shaped section is 0.1-10 mm.

8. A cylindrical body according to claim 7, wherein said cylindrical body is a biodegradable polymer.

9. A composite according to claim 8, wherein said fiber structure is an aliphatic polyester.

10. A cylindrical body according to claim 9, wherein said aliphatic polyester is polylactic acid, polyglycolic acid, polycaprolactone or a copolymer thereof.

11. A cylindrical body according to claim 7, wherein the mean fiber size of said cylindrical body is 0.05-50 μm .

12. A method for production of a cylindrical body composed of a fiber structure with a basis weight of 1-50 g/m^2 , wherein the spacing of the bellows-shaped section is no greater than 2 mm and the depth of the bellows-shaped section is 0.01-0.1 mm, which method comprises a stage of producing a solution of an aliphatic polyester in a volatile solvent, a stage of spinning said solution by an electrostatic spinning method, a stage of obtaining a fiber structure accumulated on a collector, and a stage of molding said fiber structure into a cylindrical body having a bellows-shaped section with a spacing of no greater than 2 mm.

13. A method for production of a composite composed of a cylindrical body and collagen, wherein a composite is formed of a cylindrical body produced by a method according to claim 12, and collagen.

14. A method for production of a composite composed of a cylindrical body and collagen, wherein a cylindrical body produced by a method according to claim 12 is impregnated with a solution comprising collagen dissolved and/or dispersed in a solvent, and then at least one method is employed to fix the collagen by gelling, crosslinking or drying.
